PERI LTD
CONSTRUCT Concrete Structures Group Limited is an association, membership of which is based on specialist concrete contractors and associated companies in the supply chain, notably those in the ready mixed concrete, formwork and reinforcement industries. Its objectives are to promote excellence in concrete structures and to introduce measures which will improve construction efficiency and productivity.

The members of CONSTRUCT identified the need for physical reference panels to demonstrate typical finishes. The DETR agreed and offered 50% funding for a project to produce and locate panels at strategic sites throughout the UK. The National Concrete Frame Specification (NCFS) and subsequently, the National Structural Concrete Specification for Building and Construction, adopted the standards for concrete finish given in BS 8110 Structural Concrete and the reference panels and guidance notes have been produced for use with both specifications.

These notes have now been updated so that they are in accordance with the NSCS 4th Edition which has adopted BS EN 13670 Execution of Concrete Structures.
CONCRETE FINISHES - REFERENCE PANELS
GUIDANCE NOTES FOR INTERPRETATION AND USE

(Refer also to NSCS Standard Specification clause 8.6.1 and BS EN 13670: 2009 clause 8.8)

Introduction

These panels constitute a realistic, consistently achievable standard as a benchmark for the benefit of the construction industry. They represent interpretations of the most often used finishes in situ concrete, agreed by a committee of experienced, professional practitioners appointed by CONSTRUCT.

It is impossible to produce panels with a perfect finish straight from the formwork. Neither is it practical to produce panels with a ‘just acceptable’ range of blemishes such as blowholes, surface irregularities, colour variation and arris lines. The panels produced have therefore been assessed in conjunction with these guidance notes. They should be reviewed from a standard distance of 3 metres and the prevailing light and ambient conditions should be taken into consideration.

Information on the materials and methods used are only for background information. The panels are considered to be representative, irrespective of the type of material, methods and reuses of formwork used.

DETAILS OF PANELS - CONSTRUCTION DETAILS (Central)

CONCRETE C28/35

Materials:
- Cement: CEM I - Rugby, Southam
- Aggregate: 20-5mm granite - TQ Products, Cliff Hill
- Sand: Concrete sand - Ideal Aggs., Linghall
- Admixture: Grace Construction Products WRDA 90

Mix details:
- 300kg/m³ cement; w/c 0.59; agg/cem 6.41; 45.3% sand

FORMWORK

Design:
- Pour rate: Both finishes 6 m/h
- Consistence: Both finishes 75 mm Slump
- Temperature: Both finishes Concrete +10 °C; Air 15-25 °C

Materials:
- Face sheeting: Ordinary finish Douglas fir G1S plywood; Plastic splay arris former
  Plain finish Resin impregnated paper faced plywood (Pourform)
- Secondary support: Both finishes Timber 100mm x 75mm nominal PAR; ply joints backed
- Primary support: Both finishes PERI GT24300 lattice girders as soldiers
- Release agent: Ordinary finish Chemical - Admast Adolease
  Plain finish Chemical - Admast Adolease

REINFORCEMENT

See Page 2 Both panels

CONSTRUCTION

Delivery: Concrete Both finishes Ready-mixed (approx. 35 min. travel)
Consistence: Concrete Both finishes 90 mm Slump
Placing: Concrete Both finishes Crane and skip
Pour rate: Concrete Both finishes 6 m/hr
Compaction: Concrete Both finishes Internal vibrator - 65mm petrol driven
Temperature: Concrete Both finishes Concrete (unknown); Air 16°C
Striking: Formwork Both finishes Approx. 80 hours
Curing: Concrete Both finishes Exposed to the weather

ORDINARY FINISH - GUIDANCE

This is for use where visual quality is not important or it is to receive applied finishes. It is recommended that this finish is not used where surfaces are only to be painted. The use of small panel forming systems is considered suitable for producing this finish. Joints between formwork panels will show and the step may be up to 5mm. Grain marks are generally due to slight absorbance variations causing local colour variation, but the surface is generally smooth. Panels and bolt holes may not be a regular pattern. Colour of the finish will vary with the concrete delivered, the release agent used and reuse of the forming material. Project sample panels should not be specified for this finish. As the concrete finish is not important visually, making good is acceptable and so blowholes and minor surface blemishes can either be dealt with or accepted untreated by agreement between the CA and Constructor based on achieving an overall standard similar to the reference panels. If a system formwork is to be used eg Peri Trio/Duo, the finish of the formwork will generally be acceptable and the CA is expected to be aware of its quality.
ORDINARY FINISH - INTERPRETATION (Central)

These panels are typical of what should be expected of an Ordinary finish, subject to the comments below

**Surface**
**Blemishes**

Note: Sealing of joints in formwork would reduce grout loss at edges

Outside Specification should be made good for exposed finish

**Abrupt**
**Irregularities**

All ply joints within Specification
Mechanical damage may be removed if required

**Making Good**
Typical bolt hole making good shown - recessed and flush

**General**
Very low number of blow holes at top of pour/panel
PLAIN FINISH - GUIDANCE

A Plain finish is for use where visual quality is of some importance such as areas occasionally seen or to be directly painted. The use of sheet material to limit jointing in forming material is considered suitable for producing this finish. In any one visible elevation the sheets should be of the same type and have had the same number of previous uses. Joints between formwork panels will show and the step may be up to 3mm. Tie-bolt holes should ideally be recessed, or alternatively filled flush, although this may not be so aesthetically pleasing. Panels and bolt holes should be in a regular pattern. Colour of the finish will change with concrete delivered and reuse of the forming material. A special product sample panel should not be specified for this finish, but a project example should be produced as one of the first areas of concrete poured on the project and used as the benchmark for the rest of the concrete.
PLAIN FINISH - INTERPRETATION (Central)

These panels are typical of what should be expected of a Plain finish, subject to the comments below

Surface
Blemishes

Note: Sealing of joints in formwork would reduce grout loss at edges

Within specification

Abrupt
Irregularities

Mechanical damage may be removed if required

Colour

Note: Mastic sealing of joints in formwork would reduce edge and joint discolouration

Darkening at arrises, bolt holes and ply joint might need making good for exposed finish

General

Occasional large blowhole can be made good if required
